AB A functional group is activated on the surface of a support, e.g., microscopic glass slide or polypropylene membrane, by reaction with an activating reagent and then reacted with an amine component. A support with a dendritic polymer structure on its surface and the use of such support for binding biopolymers are also claimed. For example, amino-functional glass substrates (slides) were treated in sequence with 4-O2NC6H4OCOCl in CH2Cl2 in the presence of (Me2CH) 2NEt, with tetraethylenepentamine in DMF, with 4-O2NC6H4OCOCl as above and, finally with 1,4-bis(3-aminopropoxy) butane in DMF to give a
